

The POLYOMINOES PROJECT PACK, by Bob Fox, is designed to promote mathematical investigations into the properties of polyominoes. (A polyomino is an arrangement of squares connected by their edges. There is 1 possible monomino, 1 domino, 2-trominos, 5 tetrominoes and so on...) The pack comprises a Teachers Guide, copyright-free Pupils' Workbook and five (yes, 5) programs:

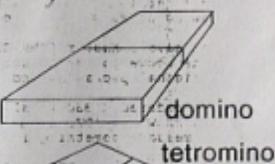

- **TESSELLATOR** is an open-ended program which allows students to explore the properties of all or any of the possible polyominoes on a grid, either as simple patterns or pictures of the more complex areas of tessellation and symmetry. Designs may be saved to disc for access by PRINTER and CAROUSEL.
- **PENTOMINOES** There are 12 possible pentominoes, and this program displays them all and invites you to fit them into a variety of different 60-square grids. Patterns may be saved to disc for access by PRINTER and CAROUSEL.
- **HEXAMAKER** Students as young as 7 years old can derive the 12 pentominoes, but finding all 35 hexominoes is a much more demanding task – particularly for the teacher or parent, who has to check them all! HEXAMAKER enables the student to test his ideas on screen, with the computer doing the checking.
- **PRINTER** works with an Epson (or compatible) printer, dumping students' designs or solutions to paper for display or as records of work.
- **CAROUSEL** allows the creation of 'slide shows' of designs and solutions. This program is intended for use at Open Days, Maths Evenings and so on, where its eye-catching qualities can be well-employed.

Skilled programming, professional screen displays and ease-of-use means that the POLYOMINOES PROJECT PACK challenges students of all ages. Young children use it to investigate spatial relationships or just to make patterns; upper primary and lower secondary pupils use it as a worthwhile maths investigation, while GCSE students are tackling coursework with its help. *The astute teacher will find in POLYOMINOES all sorts of possibilities for investigative work, as well as pointers to the level of development of individual pupils' thinking.*

I've  
found 13  
different  
hexominoes!

# GIANT KILLER

GIANT KILLER is our best-selling program. Written by Peter Killworth – author of classic games like *Philosopher's Quest*, *Countdown to Doom* and *Return to Doom* (all available from Topologika) – Giant Killer is an adventure game for students of 10 to 14-plus with a challenging mathematical content which includes:

- calculation
- tessellations
- mapwork
- topology
- number patterns
- time and space
- logic
- compass directions

*There MUST be a magic bean around here somewhere!*

Giant Killer is based (loosely) on the tale of Jack and the Beanstalk. As Jack – or Jackie – your mission is to go to market to buy a pig. They've all been sold, so you spend your mum's last groat, tackling some irresistible mathematical games stalls, winning – you've guessed it – a magic bean. Planting it (*where?*), you climb the instant beanstalk to the clouds, circumnavigating a castle (*what shape?*), figure out how to get in (*dodging the Giant's cat – and mouse*) and how to beat him at chess. Your goal is to win points and collect treasures that will please your mum when – if – you get home. *Giant Killer* comes complete with:

- Worked Solution (helps you keep one step ahead)
- 24 page Information Booklet (introduces adventure games and suggests ways of using the program in the class/home situation)
- 12 page Player's Guide
- copyright-free puzzle clue sheets

See Thomas, A & B Computing, November 1987: "An address to providing children with an exciting diversion from ordinary maths and the opportunity to practise on important problem-solving activities, GK provides a framework for the teacher to organise his/her classroom teaching in original ways, or for the parent to enjoy some 'readable mathematics' with his/her offspring. The puzzles are... among the most interesting... The logic skills, in which the user has to place figures in a castle so that there are an even number in each row and column, the Giant's beanstalk, in which four networks of threads, all with 14 nodes, provide circuits which have to be connected without going over the same wire..."

*Giant Killer* is stretching individuals (including parents), inspiring small groups and challenging whole classes in schools all over Britain. It's a computer game that involves thought rather than physical dexterity, that challenges parts of the brain that other games don't reach, rather than appealing to the 'killer' instinct... Why not give your class, daughter or son the chance to try this fascinating maths investigation?

**SPECIAL OFFER** *Giant Killer* is available for a whole range of micros including most popular home computers (see order form). Why not send the program to us now? For every copy of *Giant Killer* that you order from us, we'll give you a credit note in the value of 10% of the full price of *Giant Killer*. This means that by selling 10 copies of *Giant Killer*, you can recoup more than the cost of your own copy... Orders must be placed with us direct, and must be paid for in advance.

# PUNCTUATE!

Punctuate! provides the opportunity for children to practise the skills of punctuation without picking up a pen. It uses the power of the computer to motivate children to want to improve their punctuation.

Stories are displayed on the screen with pre-selected punctuation marks deleted. Children rebuild the passage using memory, context, and syntax. Working in groups they read the story aloud, trying a full stop here, a comma there, until the story 'sounds right'. Scoring encourages accuracy. They work against the computer at a pace which can be varied from untimed (ideal for children with special educational needs) to 'whirlwind'. In addition to controlling the speed at which the program works you can:

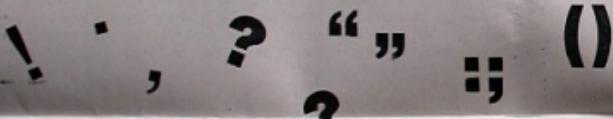

- control which punctuation is deleted for particular children
- choose which texts are presented to particular children
- create your own bank of single or multi-screen texts
- store texts on disc for later use

The texts that you create can be taken from published works (maybe the current class reader or non-fiction drawn from the current topic), stories that you've written featuring the children themselves, or even the children's own stories. They can even type them in themselves. Its that easy! Several 'starter texts' are provided, as is a comprehensive on-screen tutorial which explains clearly how to use the program. This is backed up by a detailed manual.

Punctuation is a skill that some find easy; others, despite regular exercises and explanations, enter adulthood with only a crude idea of what it's all about. Punctuate! gives them another opportunity to come to terms with this important basic skill. It suits learners from 7 up, and is increasingly popular in centres dealing with adult literacy.

# YES Chancellor!

## Economy Role-playing Game

Move into 11 Downing Street to see if you can run Britain's biggest business better than the Chancellor!

Yes Chancellor! attempts to help anyone with an interest in the economy — housewife, student, teacher or layperson — to get to grips with some of the Chancellor's problems. Governments have to be elected, so the object of the game is to stay in power by winning an election every five years. Survive for fifteen and you'll win a Life Peacock!

Based on a simplified but in principle correct model of the problem of raising and spending money, Yes Chancellor! takes you through key decisions... Will you sell some of your Reserves? What tax rate will you set? How much will you raise by borrowing? How will you share the revenue between Defence, Law and Order, Education and Social? Will you settle strikes amicably or seek confrontations? What bank rate will you choose? Foreign trade? Random numbers are used to reflect the uncertainties of the real world, but these are kept within the bounds of probability so that all program developments are logically tied to your decisions. This means that you can explore the impact of particular strategies on the economy. Will you follow Mrs Thatcher's lead, or try something more akin to Mr Kinnock's?

The booklet included with the pack takes you through the program step by step, and includes notes on terminology, factors to be taken into account when considering particular decisions and of the many and varied statistics and graphic displays provided.

Yes Chancellor! has been a great success in British schools and colleges. Author Tom Tait is an economics graduate of London University who has written many books and articles on the inner workings of business, being awarded the CBE in 1977. He has written a book and occasional articles on the technical aspects of taxation and does regular selection interviewing for the tax inspectorate.

Understanding what's happening to Britain's economy is no mean challenge. Indeed some would say that even the government doesn't know exactly what's going on — that the uncertainties of the world's money market systems make it more of a game than a science. Yes Chancellor! gives you or your students the chance to join in the game without the responsibility of really affecting peoples' lives.
