

1. INTRODUCTION

On the 6th of June 1944 the Allied Forces stood poised for the invasion of France in what was to be the largest operation of its kind in the history of human warfare.

This simulation covers the actions of the British 6th Airborne Division, the first Allied unit to land on French soil. Their objective was to secure the left hand (east) flank of the D Day beach-heads to protect the sea landings from counter attacks across the river Dives. This was to be achieved by capturing and holding intact the two bridges over the Caen canal and river Orne, and destroying the bridges over the river Dives, thus cutting a large area off from possible German reinforcements. A further objective was to capture a coastal defence Battery at the mouth of the Orne, which was in a position to fire on the main sea landing area.

The first troops to land, known as the coup-de-main party, were detailed to take the bridge over the Caen canal, and this bridge was later renamed Pegasus Bridge, after the winged horse emblem of the airborne troops. Pegasus Bridge, the game, covers the period from that first landing of the coup-de-main party to the arrival on the scene of troops from the beach-heads. The plan was daring, and many things could have gone seriously wrong as the player will find out.

2. LOADING

3. CBM 64 VERSION

(i) Getting Started

After the game has loaded there are a number of options which need to be set up before starting the game. These are presented to the player one after another and can be selected by pressing the indicated key, or by using the joystick to change the option, and fire to select it. The options are:

1. Start a new game/load a previously saved game
2. One player vs computer/2 players/demonstration mode
3. British or German side
4. Level of difficulty 1-3

The game then begins.

Restoring a saved game can only be done at the start of a game. However, any non-demonstration game can be saved at the start of any British turn, after turn 1, and this option will be offered by the computer. Remember to use a fresh tape or diskette if you do not wish to overwrite previously saved games.

(ii) Playing the Game

The game is divided into turns, each representing 30 minutes. The British and German sides play alternate turns. Each turn is divided into 5 phases:

1. Reinforcement allocation phase
2. Support phase
3. Orders phase
4. Reinforcement arrival phase
5. Suppression phase

Each of these phases is described in detail in the following sections.

(a) Reinforcement Allocation Phase

The player will find it useful to refer to the map whilst playing through this phase.

In this phase the player selects the intended arrival area of any reinforcements scheduled to arrive at the end of the ORDERS phase. Each unit will be offered in turn, with its historical arrival point displayed, and the player will be offered one of the range of alternative arrival points available to his units. The alternative points may be paged through, by use of the joystick or cursor keys, and the final selection will be actioned when 'FIRE' or 'SPACE' is depressed. The computer will check the order and reject it, if it is not permitted for the unit to arrive at that particular site.

A typical selection would look like this:

Unit Identity	Historic Arrival Point	Reselected Arrival Point
ANI CON	ARRIVES AT	Y ? X

When selecting points of arrival, a rough map of the playing area, with the arrival points identified, may be viewed by selecting '?' and pressing 'FIRE' or 'SPACE'.

The airborne British Forces may only arrive at landing or dropping zone locations, lettered K, N, V, W, X and Y, and later in the game commandos and tanks arrive at locations A and B as they move up from the beaches. Gliderborne troops can only arrive at N, W, X and Y.

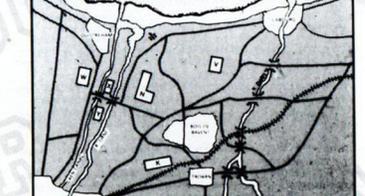

German anti-aircraft fire destroyed or damaged many of the tugs (towing aircraft) and troop transports, causing many of the tugs to be wrecked and gliders to cast off at the wrong point. This together with high winds, an element of poor navigation, and a certain amount of bad luck, caused a great deal of confusion, so that units went astray and failed to land at their designated site, some failed to arrive at all.

This is reflected in the game and whilst most units land where ordered, they cannot be relied upon to arrive exactly where expected. Their actual arrival points will only be disclosed as they arrive on the map following the British ORDERS phase.

The first 12 German units are already on the map at the start of the game, but are dormant and only reveal themselves after the British arrival. On turn 1 the first 3 appear and, on turn 2 the remaining 3 units become active. The latter are all in the town of Troarn, the cluster of buildings at the crossroads in the lower right of the map. These 12 units always set up in the same position and the German player is not given the option of changing these.

All subsequent arrivals may not have their historic arrival points changed, but in odd cases units may arrive at an alternative start point to reflect routes on the map being made impassable by strafing, bombing and/or heavy gunfire. Like the British, the actual arrival point will only be revealed when the unit appears on the map after the German ORDERS phase.

The historical arrival points for the British are accurate according to the intentions for the day, but the German units are, in several cases, only approximate, since the available records relating to D-Day from the German viewpoint are often vague or conflicting in detail, as is precise information regarding the units involved.

MOVIE

Phasing Unit	Coordinates
Landing Zone A, B	D 20, J 0 & B 0
Landing Zone W	W 0, C 0 North-West
Landing Zone X	W 0, C 0 South-East
Dropping Zone Y	T 2 & B 1 Para
Dropping Zone V	T 10 Canadian Para & 8 Para

(b) Support Allocation Phase:

At the start of the game each side will have a number of support factors, in the shape of fighter and bomber sorties, and naval gunfire (British side only). The British start with 6 naval gunfire attacks available from turn 1, and from turn 11, 8 fighter and 4 bomber sorties become available. From turn 11 the German forces have 9 fighter and 7 bomber sorties available.

When available these are offered to the player to select whichever attacks he or she may wish to make. Each type of attack selected will need the input of X (East/West) and Y (North/South) co-ordinates, and the separate scale map enclosed with the game can be used to accurately determine these. Whilst gunfire, bombing and strafing can be selected against any target, only one set of co-ordinates can be specified for any given type of attack, and the co-ordinates are selected by use of the joystick or cursor keys.

Fighters have an alternative option to strafing, which is flying interception. In this mode they will try to intercept any enemy air attacks ordered for that turn. Over the actual period covered by the game (18 hours), the only British gunfire support in this area was scheduled to be directed against the Merville Battery but, because the attack on the Battery was successful, did not need to be evoked. There was little significant in the way of co-ordinated air support from either side during this period, except for an attempt by the Germans to bomb the Caen canal bridge.

In consequence the computer, as an opponent, will not select any support options, except when controlling the German side, when it will fly a bombing sortie against the Caen canal bridge.

Any support attacks are likely to be badly aimed or poorly navigated and, whilst there are possibilities of causing casualties and inflicting damage, the chances of these being other than marginal are successful are quite low. Support attacks are always applied at the end of the enemy turn, after the reinforcements arrive phase.

(c) Orders Phase:

This is the main game turn per se, where units can be moved, ordered to attack, dig in and, in the case of certain units, demolish bridges.

The Screen Display

The screen will reproduce a portion of the playing map, over the lower two thirds of display. In a box at the top left of the screen, unit statistics and general information messages are displayed. There are two boxes to the top right of the screen, the uppermost of which displays a green oblong which represents the entire playing area of the game map. Superimposed on this is a black box which indicates the actual portion of the map currently being displayed, to assist the player in identifying the position of the unit in play (Phasing Unit). The lower box displays the current game turn.

Select Option

The first options offered are SELECT UNIT REVIEW MAP

If the 'SPACE' key or the 'FIRE' button is depressed when either selection is highlighted (white), that option will be actioned.

To change a highlighted selection, move the joystick left or right, or use the cursor keys, and the alternative selection will be highlighted in turn ('UPDOWN' moves left, 'LEFT/RIGHT' moves right.)

If 'SELECT UNIT' is ordered the game will continue to the actual ordering of the units under the player's command.

If 'REVIEW MAP' is selected the player will be able to look around the game map by using the keys Q, W, E, A, D, Z, X, and C as described in the MOVE section, or by using the joystick.

When the player has seen all that is desired, and has made a note of any locations of particular interest, then 'SPACE' or 'FIRE' will move to the actual ordering of units under the player's command.

Unit Selection

There are three possible orders that can be given, and these are selected and highlighted as previously described.

These options are STACK UNIT NEXT STACK.

If the unit being considered is currently stacked (see STACKING) this option will be offered and if selected means that all of the units in that stack will receive and attempt to action the same command together. If the unit is not currently stacked, this option will not be offered.

UNIT:

If a unit is not stacked, this option will ready it to receive orders. If the unit is stacked, then this option will unstack it and ready it to receive orders, without affecting the remainder of the stack.

NEXT:

If the player does not yet wish to order the unit under consideration, then this option will move to the next possible unit still available to receive orders.

This option will also allow the player to select a specific unit out of a stack of units in a stack are always displayed in the sequence that they will be offered to the player, but the unit currently selected will be displayed in blue. Thus selecting 'NEXT' the player can skip an earlier unit in the stack, and when the next displayed will know the selectable unit by its colour.

This can be particularly useful if units with different ranges are stacked together and the player wishes to make use of a unit with a longer range, currently in the stack, or when the player wishes to move a unit out of the stack.

Ordering Units

Having selected a stack or a unit, it must then be given orders. Only one order can be selected for a unit per turn, and once ordered the command cannot be revoked. Each order takes a full turn to execute. There are five possible options and these are as follows:

DEMOLITION:

Only a unit capable of blowing up a bridge will be offered this option, provided that the unit commands the turn selected. When selected the command can only be evoked if the unit is stacked or destroyed and becomes impassable once the destroying unit exits the square.

This option is particularly important in the light of the victory conditions (see VICTORY CONDITIONS), and units capable of using this option should be noted and used carefully (see UNIT LIST).

ATTACK:

When this is selected, any units within the range of the attacking unit will be indicated by a square selection box being superimposed over the possible target areas. When this is selected, statistics displayed in the general information area.

The prompt 'YES/NO' will be offered and if 'YES' is selected the unit will be attacked, with the results of the combat being displayed on the combat screen.

If 'NO' is selected the box will move to the next possible target, finally returning to the first target offered, if none has been selected. By this means the player is able to reveal all of the possible enemy targets before committing the phasing unit to an attack.

If there are no enemy units in range the computer will inform the player accordingly, and this will complete the turn for the phasing unit/stack.

MOVIE

When this is selected the computer will prompt the player with 'DIRECTION?' and the direction is selected by moving the joystick in the appropriate direction, or by using the keys indicated below, with the key indicating the direction from the centre, assuming that the '*' is the unit's current position.

Q W E
A * K
Z X C

If the player elects to finish moving having expended all movement factors (see UNIT FACTORS), press 'SPACE' or 'FIRE' to 'PASS' and end that unit's turn.

DIG IN:

If this is selected the unit selects the turn 'digging in' which will increase its defence factor. Once dug in, a unit need not select this option again, unless it has moved, when it will have lost any previous benefit of having been dug in. Digging in on consecutive turns will not improve this benefit, but will do no harm should the player have forgotten whether the unit has dug in since last moving.

PASS:

If the player has no special action for a unit to take this turn, then selecting 'PASS' will skip that unit's turn.

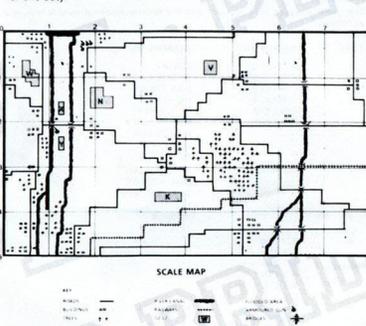

(d) Reinforcement Arrival Phase:

During this phase units arrive on the map. In the case of the British, the arrival point can differ wildly from the point selected, and this represents the difficulties experienced in dropping troops in the correct area, due to navigational errors, gusting winds, and transports and tugs being shot down or damaged causing units to jump or cast off earlier or later than intended.

In the German case, only a few units may arrive at unexpected entry points. Arrival on the map ends that unit's actions for that turn, and the player will again be given the option of reviewing the map.

(e) Support Phase:

In this phase support attacks ordered by the enemy are carried out. Fighters will attempt to strafe, bombers to bomb and naval gunfire to shell the co-ordinates designated. These attacks may miss because the enemy has moved from the target area, the co-ordinates were wrong, or there are navigational or ranging errors, and aircraft may be intercepted by friendly planes designated for this duty.

The Map

On the map the player will see symbols which are interpreted as follows:

Terrain	Description/Shape	Movement	Cost	Notes
BRIDGE	black 'bow tie' shape	1 point	The main objectives	
ROAD	brown mottled squares	1 point		
LZ/DZ	grey mottled squares	1 point	Airborne troops arrival zones	
RAILWAYS	black ladder shapes	2 points		
OPEN	yellow squares	3 points	Rough country, open fields	
TREES	green trees	4 points	Bois de Barent	
BUILDINGS	black houses	4 points	Each a cluster of buildings	
FABRIC/FACTORY	black shapes	5 points	The Merville Battery objective	
SWAMP	green tufts	6 points	Flooded areas around the Dives	
WATER	blue shapes	9 points	Rivers, canals, estuary - only negotiable by Frogmen/Gunboats	

Terrain has two main effects on the game, the first being to regulate the 'speed' of movement. When a unit crosses terrain it must expend movement points for every square entered, and if it has insufficient points left to exit a particular square, the unit halts after entering it.

The second effect is that of influencing the defence factor of the unit occupying the square. Units in the open DF on roads are obviously more vulnerable than units concealed in trees or buildings, so that, generally, the higher the movement cost of the terrain, the better the unit's defence.

The German frogmen unit is always displayed in its true position on the map, but to reflect the fact that it can always 'submerge' and unnoticed, the unit will often not be available as a target when an attack is ordered.

(v) Combat:

The results of combat are determined by the computer, using the attack factor of the attacking unit(s) and the defence factor, or armour, of the defending unit(s).

The range factor of the attacking unit represents the maximum range at which the unit will attack, for the purposes of the game. Paratroopers and glider troops tended to be armed with sub machine guns, such as Sten and Thompson machine guns, which were generally at their most effective over relatively short ranges, but some units had a higher than average proportion of longer range weapons such as Bren-guns, and this is reflected in the attack factors.

The German infantry and grenadiers were mostly armed with a mixture of machine pistols and rifles, but some units were poor quality troops and due to their training were only really effective at short ranges.

Tanks and artillery throughout the battle tended to fight at relatively short ranges, and even over open sights, and this too is reflected in the range factors of the units.

The attack factor of the attacking unit is modified by the range over which it is attacking, so that a tank with an attack factor of 24 and a range factor of 12 squares would in fact have a reduced attack factor of 18 over squares 12 over 6 squares, and 6 over 3 squares. It would not be permitted to attack a unit that was more than 12 squares away from it.

If an attack is successful then the number of attacking units (men, tanks or artillery pieces) is used to determine the casualties taken by the defending unit(s). In turn, if the attacker is within the defender's range, the defending unit(s) will return fire, and the results of this will be applied to the attacking unit(s).

For the purpose of this simulation, units which can no longer fight, because all of the members of the unit are either dead, wounded or too demoralised to fight on, are considered eliminated and are removed from the map to take no further part in the battle.

A unit may only attack once during its turn, but it can return fire every time that it is attacked, provided only that the enemy is within the defender's range, and this return fire is automatically taken into account by the computer.

(v) Stacking

Stacking is the ability to put more than one unit in the same square, and then move or order the STACK of units as though they were one combined unit formed from the units constituting the stack. For the purpose of the simulation no more than 3 units can be stacked together at any one time, regardless of the number of 'men' in each unit, and it is not possible for a unit to move through a stack.

In order to stack it is only necessary to enter a square occupied by a friendly unit or stack. On entry to the square all movement ceases and no further action is permitted of the moving unit or of the units with which it has stacked. It is important, therefore, to ensure that any units about to be joined in a stack, have already completed any required action for the turn.

To unstack a unit, note its position in the stack, and select 'UNIT', when its statistics are displayed in blue, and the unit will be unstacked and readied to receive orders.

Being part of a stack has certain advantages and certain limitations, and these need to be considered when STACKING or ordering units.

The Advantages are:

1. Units attack in co-ordination, potentially inflicting greater damage
2. Units defend in co-ordination, and damage is usually, but not always, shared proportionately between the units forming the STACK.
3. Only one order suffices for all the units in the STACK, provided that the player wants them all to perform the same act.

The Limitations are:

1. The maximum attacking range of all units in a STACK is limited to that of the unit with the least range. The computer assumes that if a STACK is ordered to attack, all of the units in the STACK are expected to take part, so care must be taken to ensure that there is a target in range if the order is not to be wasted.

For this reason, the computer as an opponent will rarely stack its longer ranged units, such as tanks and artillery, with infantry units.

2. In a similar manner, the maximum movement allowance for the STACK is that of the unit with the least movement allowance. If a STACK is to move it must travel 'slowly' enough for the slowest unit to keep up.

NOTE

Just south of the Caen canal bridge is a gun emplacement, and the first unit of either side to enter the square will convert this to a 20mm anti-tank gun, with a movement factor of zero, for use by their forces. This can only be achieved by STACKING in the emplacement, and is the only time in the game when equipment can be 'picked up'.

Historically, the gun emplacement existed and was captured by the coup-de-main party, it being unarmoured at the time of their arrival.

(vi) Tactics and Level of Play

When the computer is playing one of the forces against a human player, the player is asked to select a level of difficulty on a scale of 1 to 3. The level of difficulty determines the TACTICS used by the computer, and these are as follows:

Level 1

The enemy will not always attack at the most dangerous range and when moving units will rarely bother to check to see if they are moving into dangerous positions. Effectively, the units are both brave and foolhardy, and will often risk all to achieve what they see to be their most obvious objectives.

Level 2

At this level the computer's units are more careful, but will still from time-to-time behave with less caution, and move without regard to the proximity of enemy units. This is arguably the most realistic level, both sides being quite committed to achieving their objectives, but not necessarily at any cost.

Level 3

Here the computer's units are extremely cautious and will usually cease movement as soon as an enemy target is within their range. They represent troops who are committed to achieving their objectives, but with as little risk as possible, so that the game time scales become less important to them. They are not likely to close with the enemy if they can just sit back and pick him off from a distance, however long it may take.

In some ways this can reflect the German actions on D-Day in this sector, for many of the elite troops were anxious to close with the invaders, to try to destroy them where they landed, their commanders were not convinced that this was the real solution. Many thought that this was just a diversionary tactic, a feint, and orders to attack and/or attack were frequently countermanded within an hour of being given. In consequence the German units were often in some cases quite low quality units, and did not always press home their attacks or simply stood off from their opponents, firing from long range.

It must not be assumed that the Germans were lacking in bravery, and indeed many instances occurred to refute such a suggestion. A particular instance was when a Fallschirmjäger (paratrooper) sergeant named Hickman was returning to his barracks near Caen with a jeep containing four recruits that he had collected near Quistebam, at around midnight. Hearing gunfire from the Caen/Orne bridges area, the sergeant drove the jeep to investigate. Although he and his men were only armed with machine pistols, they exchanged fire with the coup-de-main party, until their ammunition was exhausted, before driving south to report the situation.

The German frogmen unit is always displayed in its true position on the map, but to reflect the fact that it can always 'submerge' and unnoticed, the unit will often not be available as a target when an attack is ordered.

The results of combat are determined by the computer, using the attack factor of the attacking unit(s) and the defence factor, or armour, of the defending unit(s).

The range factor of the attacking unit represents the maximum range at which the unit will attack, for the purposes of the game. Paratroopers and glider troops tended to be armed with sub machine guns, such as Sten and Thompson machine guns, which were generally at their most effective over relatively short ranges, but some units had a higher than average proportion of longer range weapons such as Bren-guns, and this is reflected in the attack factors.

The German infantry and grenadiers were mostly armed with a mixture of machine pistols and rifles, but some units were poor quality troops and due to their training were only really effective at short ranges.

Tanks and artillery throughout the battle tended to fight at relatively short ranges, and even over open sights, and this too is reflected in the range factors of the units.

The attack factor of the attacking unit is modified by the range over which it is attacking, so that a tank with an attack factor of 24 and a range factor of 12 squares would in fact have a reduced attack factor of 18 over squares 12 over 6 squares, and 6 over 3 squares. It would not be permitted to attack a unit that was more than 12 squares away from it.

If an attack is successful then the number of attacking units (men, tanks or artillery pieces) is used to determine the casualties taken by the defending unit(s). In turn, if the attacker is within the defender's range, the defending unit(s) will return fire, and the results of this will be applied to the attacking unit(s).

For the purpose of this simulation, units which can no longer fight, because all of the members of the unit are either dead, wounded or too demoralised to fight on, are considered eliminated and are removed from the map to take no further part in the battle.

A unit may only attack once during its turn, but it can return fire every time that it is attacked, provided only that the enemy is within the defender's range, and this return fire is automatically taken into account by the computer.

Stacking is the ability to put more than one unit in the same square, and then move or order the STACK of units as though they were one combined unit formed from the units constituting the stack. For the purpose of the simulation no more than 3 units can be stacked together at any one time, regardless of the number of 'men' in each unit, and it is not possible for a unit to move through a stack.

In order to stack it is only necessary to enter a square occupied by a friendly unit or stack. On entry to the square all movement ceases and no further action is permitted of the moving unit or of the units with which it has stacked. It is important, therefore, to ensure that any units about to be joined in a stack, have already completed any required action for the turn.

(ii) Playing the Game

The main map screen is divided into 4 areas. The scrolling map area on the right is a window into the play area, showing units and terrain. A cursor can be moved around this area, and when it reaches the edge, the map scrolls. The top left map covers the whole play area, showing the position of the main map window as a rectangular box, and units as individual dots. Flashing dots show units which have yet to act in the current phase.

Below this is the unit display area. This shows the time and data for the units) under the cursor on the main map. The square icon boxes show the unit symbols for the units) under the cursor or "picked up" for movement. Under this is the unit data.

MOVE — Shows the speed of the unit
M LEFT — Shows the number of movement points left
RANGE — The maximum firing range of the unit
AF — The attack strength factor of the unit
EFFECT — The percentage effectiveness of the unit
STR — The number of men/vehicles in the unit.

When two or more units move into the same square, they are said to be stacked. The status information flashes between the different units in the stack.

At the bottom of the screen is a one-line text area for prompts and messages. The game is divided into turns, each representing 30 minutes. The British and German sides play alternate turns. Each turn is divided into 4 phases.

1. Reinforcement phase
 2. Movement phase
 3. Support phase
 4. Combat phase
- Each of these phases is described in detail in the following sections.

(iii) Reinforcement Phase:

The British players reinforcements mostly arrive by air, and the landing site is chosen for each unit as it arrives by moving the cursor to the desired position and pressing fire. The cursor is initially positioned in the historically correct landing site for each of the landing sites. The large open areas are the open areas, since landing on rough ground, woods, towns and roads will result in varying degrees of loss of effectiveness of the unit. Note also that the unit will not land normally and exactly where you want it to, but may be scattered by high winds. This can add to loss of effectiveness. Effectiveness is recovered slowly over a period of time, as stragglers join the unit.

German and British ground units appear on the map at predetermined times according to the reinforcement schedule. These start positions cannot be altered.

(iv) Movement Phase:

During the movement phase all the players units can be moved by moving the cursor over the units and pressing fire to pick them up. Up to three units can be picked up together and moved as a stack. Pressing fire again drops the units. Movement through different terrain types costs different numbers of movement points as detailed below.

Terrain	Symbol	Cost	Note
BRIDGE	Unit symbol	1	The main objectives.
ROAD	Solid black	1	
OPEN	Blank	1	Landing zones.
RAILWAY	Cross hatch	2	
ROUGH	Spars	3	Rough open fields.
TREES	Tree shapes	4	Bos de Bavent
BUILDINGS	Box shapes	4	Each is a cluster
EMPLACEMENT	Star shapes	4	
SWAMP	Black mottled	6	Flooded areas
WATER	Black mottled	9	Certain units only

The terrain has two main effects on the game, the first being to regulate the 'speed' of movement. The second effect is that of influencing the defence factor of the unit occupying the square. Units in the open or on roads are generally more vulnerable than units concealed in trees or buildings, so that, obviously, the better the movement cost of the terrain, the better the unit's defence.

NOTE
 Just south of the Caen canal bridge is a gun emplacement, and the first unit of either side to enter the square will convert this to a 20mm anti-tank gun, with a movement factor of zero, for use by their forces. This can only be achieved by stacking with emplacement, and is the only time in the game when equipment can be "picked up".

(v) Support Phase:

At the end of the movement phase, the player is given the opportunity to call up bomber strikes, fighter strikes, and naval gunfire on enemy positions. The number of strikes available to each player during the rest of the game is shown at the start of each turn. If any strikes are left, the option to use them is offered during the support phase. Press fire to launch a strike or the space bar to skip it and hold it in reserve. If a strike is selected, the cursor appears on the map and can be moved over the target. Press fire to confirm.

A maximum of 1 attack each time can be performed in each turn. Fighter attacks held in reserve can help to reduce the severity of enemy air attacks.

(vi) Combat Phase:

Each unit can be ordered to attack one enemy unit. The procedure for this is similar to that for movement, as attack units are selected by placing the cursor and pressing fire. Up to three units can combine their attack strengths by stacking together. The cursor is then moved over the target and fire is pressed to launch the attack. An out of range message is generated if the cursor is moved further away than the maximum range of the attacking unit.

At the end of the turn, if any troops equipped for demolition are on a bridge, the option to blow up the bridge is offered. Press FIRE to blow the bridge, or any other key not to. The bridge will blow up during the following turn, so remember to move the unit off the bridge.

The length of the firing sound effect gives a rough indication of the effectiveness of the attack. For more precise information, inspect the units involved. Both sides may take casualties when an attack is made since defending units are allowed to return fire.

The type of the unit should be taken into account when launching attacks. Paratroopers and glider troops tended to be armed with sub machine guns, such as Sten and Thompson machine guns which were generally at their most effective over relatively short ranges, but some units had higher than average proportion of longer range weapons such as Bren guns, and this is reflected in the attack factors. The German infantry and Panzer grenadiers were mostly armed with a mixture of machine pistols and rifles, but some units were poor quality troops and due to their training were only really effective at close ranges. Tanks and artillery throughout the battle tended to fight at relatively short ranges, and even over open sights, and this too is reflected in the range factors of the units.

The combat system also takes into account the types of units involved. Sten guns are not as good as artillery against tanks etc.

5. VICTORY CONDITIONS

Each side has a certain set of objectives which must be achieved. That of the British side is to preserve intact the bridges over the Caen canal and the Orne river, to destroy, or at the end of the game in occupation of, the 5 river Dives crossings, to be the sole occupants of the area of the Merville Battery, indicated by the cluster of four gun emplacement symbols, and to maintain this position up to turn 36, the end of the game (the arrival of the remainder of 6th Air-landing Brigade).

The objective of the German side is to prevent the British side from achieving their objectives, and the degree of success will depend upon the number of objectives that the German forces have permitted the British side to achieve. The position at the end of turn 36 is used to determine the percentage of success. Should the game be terminated earlier, the number of turns played will also be used to determine the percentage of success.

In order to achieve objectives it will sometimes be necessary to eliminate enemy units, but care should be taken to remember the actual objectives of the game, as the elimination of the entire enemy force will not win the game if these objectives have not been met. Remember, this is only day one of the invasion and the enemy has many more forces to throw into the line tomorrow, so the objectives are critical.

6. REINFORCEMENT ARRIVAL SCHEDULE

Throughout the game, units will reinforce the British and German sides. They will always arrive on the turn specified and neither side can hold any in abeyance until a later turn.

Units will never STACK with other units on the turn of arrival. German units, except for those on the map at the start of the game, are likely to arrive in depleted strength. This reflects casualties from shelling and strafing, and stragglers, some or all of whom will return their unit as the game progresses, but the units are unlikely to be heavily depleted.

The British, however, suffer casualties from poor landings, made in high winds and darkness, aggravated by landings in inhospitable terrain, such as buildings, trees, water and swamps. The landings are likely to be heavily scattered, so that there can be many stragglers but, like the Germans, these too will attempt to rejoin their units throughout the game.

If a unit is eliminated, its stragglers may rejoin other units still fighting, but in no case will a unit ever exceed the strength (numbers) shown in the UNIT LIST. Units are never reconstituted during the game once they have been eliminated.

The game is played over 36 turns and the Reinforcement Arrival Schedule is as follows.

TURN	BRITISH UNIT	GERMAN UNIT

7. HISTORICAL BACKGROUND

On the 5th June 1944 the Allied forces stood poised for the invasion of France by land, sea and air. In what was to be the largest operation of its kind in the history of warfare, almost 3 million men would be involved in an invasion front covering miles of Normandy coastline from Les Dunes de Varreville in the west to Oustrehain in the east.

The British 6th Airborne Division, consisting of the 3rd and 5th Parachute Brigades, and the 6th Air-landing Division, was given a key role in the operation. Its orders were to secure the left (east) flank of the beach-heads by seizing vital bridges, neutralizing enemy gun emplacements, and denying the enemy access to the beach-heads by holding or destroying 5 of the bridges over the river Dives. Since the number of available landing craft was limited, the 6th Airborne Division at the same time, it was necessary to land parachute troops first to clear selected sites, whilst the majority of the 6th Air-landing Brigade would arrive by the second airtift.

A coup-de-main party consisting of a reinforced company of six platoons drawn from the 2nd Battalion of the Oxfordshire and Buckinghamshire Light Infantry (D' Coy 2nd O & Bucks) and a detachment of engineers, carried in six gliders, flew to the beach shortly before midnight, with the Caen and Orne bridges, as their objective. Five of the six gliders landed almost exactly on time, with considerable accuracy. Close to the two vital bridges which crossed the river Orne and the Caen canal, whilst the sixth landed close to a bridge over the river Dives, some 8 miles away.

The Orne and Caen bridges were successfully captured, and a bridgehead established. Thirty minutes later the 7th Parachute Battalion dropped, but the landing was widely scattered. Within a couple of hours about half of the force had reached the bridges, and stragglers continued to arrive throughout the day. Enemy counter attacks, from infantry and tanks, began at dawn and continued through the day, and it was whilst holding the bridges that 7 Para had a naval battle with German coastal craft moving up the canal. German aircraft tried to bomb the bridges and, indeed, succeeded in hitting the Caen bridge with a 1000lb bomb, which dented the structure, but bounced off into the canal without exploding.

At one point the Germans dispatched two frogmen to try to blow up the bridges, but this, together with other attempts, was to no avail and the bridges were held until seaborne forces arrived to help secure the area.

In the meantime 9 Para landed with the intent of eliminating the battery of guns at Merville. The drop was so widely scattered that the force consisted of only 150 men, out of more than 600 that jumped, were grouped for the assault. This attack was to be supported by a special assault group carried in three gliders, the aim of which was to land on top of the battery at the exact time that the attack went in. The gliders failed to land in the right place, but the assault group troops fought where they landed, so preventing reinforcements from reaching the battery in the meantime the main party successfully neutralized the battery, but at the loss of about half of their small force.

The bulk of the 3rd and 5th Brigades also jumped, but again the landings were widely scattered, some units dropping on zones designated for other groups; and a considerable number of men were killed or injured landing in or around the area of the river Dives, which had been made to flood its banks, by the Germans as part of their defence strategy, to present several square miles of marshland.

These units, supported by elements of the 6th Air-landing Brigade, destroyed the Varville, Robehomme, Bures and Troarn bridges, in the face of a surprised enemy. In the case of the Troarn bridge, engineers in a jeep raced through a gauntlet of enemy gunfire onto the bridge, captured it through the battle, enemy troops and a roadblock, in order to demolish the bridge.

All units then continued to hold positions against repeated enemy attacks, and at a critical moment were reinforced by commando forces from the 1st Special Service Brigade, under Lord Lovat, which had fought their way up from the beaches around Oustrehain.

During the evening of D-Day the remainder of the 6th Air-landing Brigade arrived, linking up with those who had landed in the earlier lifts, plus the commandos, and together they made the bridgehead secure.

The bridge over the Caen canal was subsequently to be named Pegasus Bridge, (after the winged horse shoulder flash worn by the airborne troops), to commemorate the battle, and the fact that the coup-de-main party was the first British unit to land on French soil on D-Day.

8. UNIT LISTS

In the following lists

NO — is the number of men. Tanks, artillery pieces, etc., initially available to the unit, and its composition as described in the ARRIVES section; of the instructions. As units take casualties this number is depleted and, if it should reach zero, the unit is eliminated, and removed from the map.

AIF is the attack factor — the unit's firepower and assault strength.
RNG is the maximum range in squares, over which the unit can attack.
MOV is the movement factor which is the maximum number of points which can be expended by the unit as it moves across terrain, and represents its speed of movement — units with a high movement factor can move further in the same turn than units with lower factors.

NOTE

When the computer is the opponent the attack factor of each of its units will be increased by 2, with a proportionate increase in the unit's range.
